GREENWICH ASTROGRAPHIC CATALOGUE

1900.

VOL. II.

INTRODUCTION.

THE history of the inception of the Astrographic Chart and Catalogue and of the early work at Greenwich, the description of the telescope with which the photographs were taken, and of the micrometer with which they were measured, are given in the Introduction to the first volume of the Greenwich Astrographic Catalogue, of which this is a continuation. This Introduction follows the scheme of that of the former volume, and gives details peculiar to the plates in this volume in addition to some common to both.

As stated in the Introduction to Volume I., the majority of the fields, with the exception of those within 10° of the Pole, which were deferred for convenience until a time near the epoch 1900·0, were taken before 1898 May. Owing to the rejection of plates found unsuitable for measurement in the course of the work, and because some had to be replaced for other causes, the photography of the Catalogue plates was not completed until 1905 October. The following table gives the limiting numbers of the photographs taken in each year:—

Year.	Nos.	Year.	Nos.
1890	1–25	1898	3809–4219
1891	26–230	1899	4220–4758
1892	231–717	1900	4759–5338
1893	718–1728	1901	5339–5904
1894	1729–2422	1902	5905–6141
1895	2423–2969	1903	6142–6232
1896	2970–3334	1904	6233–6432
1897	3335–3808	1905	6433–6585

The numbers in the years 1900 and 1901 include the plates of the fields surrounding the small planet Eros, taken for the purpose of determining the Solar Parallax, and the plates of fields containing Nova Persei.

List of Photographs of which measures are given in this Volume.

* Ilford Special Rapid.

MEASUREMENT OF THE PHOTOGRAPHS.

All the measures in this volume were made with the duplex micrometer described in the Introduction to Volume I. The glass diaphragms in the focal plane of the eye-pieces, which had been in use since the beginning of the work, were replaced on 1903 June 24, by new diaphragms with scales ruled by Messrs Zeiss, the errors of division of which are given on pages xvi. and xvii. The method of measurement of the plates in this volume was exactly that adopted in the earlier work except for the alteration made in the scheme for measurement of the plates immediately surrounding the Pole explained on p. 925 of this volume. The following table gives the dates of measurement of the plates :—

Date of Measurement of the Photographs in this Volume.

1900 January	—1900 May.	Zone 72°.	Direct and Reversed.
1900 June	—1900 October.	„ 73°.	„ „
1900 October	—1901 March.	„ 74°.	„ „
1901 March	—1901 September.	„ 75°.	„ „
1901 September	—1902 January.	„ 76°.	„ „
1902 January	—1902 June.	„ 77°.	„ „
1902 July	—1902 December.	„ 78°.	„ „
1902 December	—1903 June.	„ 79°.	„ „
1903 June	—1903 September.	„ 80°.	„ „
1903 October	—1903 December.	„ 81°.	„ „
1904 January	—1904 February.	„ 82°.	„ „
1904 March	—1904 June.	„ 83°.	„ „
1904 June	—1904 August.	„ 84°.	„ „
1904 September	—1904 November.	„ 85°.	„ „
1904 December	—1905 January.	„ 86°.	„ „
1905 February	—1905 May.	„ 87°. to Pole.	„ „

The following persons took part in the measures of the photographs :—

Mr Melotte . .	1900 January —1902 December.
„ Stevens . .	1900 January —1905 May.
„ Evans . .	1900 January —1905 May.
„ Stiles . .	1900 January —1902 September.
„ Oakley . .	1900 January —1902 January.
„ Hicks . .	1900 May —1904 December.
„ Higgitt . .	1902 March —1905 May.
„ Lyne . .	1903 February —1905 May.
„ Peirce . .	1904 January —1905 May.

The *réseaux* imprinted on the plates were those tabulated on page xxxvii. of Vol. I., with the addition of three others. As comparatively few plates were taken

with these additional *réseaux*, and the errors of those already investigated are small, it seemed unnecessary to determine their errors.

The complete list of *réseaux* is as follows :—

Number.	When brought into use.	Nos. of Plates on which it is printed.
49	1891, December 11	213–394
34	1892, May 23	395–1529
35	1893, October 4	1530–2673
71	1895, June 8	2674–3250
72	1896, September 16	3251–3838
80	1898, January 24	3839–4369
81	1899, March 13	4370–4627
90	1899, August 20	4628–5503
91	1901, March 22	5504–6180
99	1903, March 20	6181–6472
100	1905, February 13	6473–6544

Errors of Division of the Glass Diaphragm of the Measuring Micrometer.

The measurement of the plates of Zones 72° to 79° was made by means of the glass scales in the eyepieces of the micrometer whose errors are given in the Introduction to Volume I. For the measurement of the plates of Zones 80° to the Pole the new scales supplied by Messrs Zeiss were used. The measures to determine the division errors of these scales were made in the manner described in Vol. I. and except for comparatively large errors of the central division in both the scales with which the x co-ordinate is measured, the errors are for the most part small. These division errors have not been applied, the small errors arising from them being included in the accidental errors of measurement. The following small table gives corrections which could be applied if considered desirable, and serves to show that the errors introduced from the divisions of the scale are very small :—

Left hand microscope.	To x and y measures.	Apply $+^{\text{int.}}$ ·0001 from ·00 to ·50	and $-^{\text{int.}}$ ·0001 from ·50 to ·00.
Right hand microscope.	To x measures.	From ·00 to ·50 no correction.	Apply $+^{\text{int.}}$ ·0001 from ·50 to ·00.
	To y measures.	Apply $+^{\text{int.}}$ ·0001 from ·00 to ·60.	Apply $-^{\text{int.}}$ ·0001 from ·60 to ·00.

The plates whose centres are at an even degree of declination (72°, 74°, etc.) were measured under the left hand, those at an odd degree (73°, 75°, etc.) under the right hand microscope.

Division Errors of Scale of Left-hand Microscope.

(The unit is ·00001 *réseau* interval = ″·003.)

In the above tables, the columns headed "Left, Right, Lower, Upper," show the actual errors of division of the glass scale in the four quarters (*see* Diagram Vol. I., p. xix., Plate II.). In forming the columns headed "Mean," these quantities are weighted in the same way as the measures on the two sides of the scales in forming the means. Quantities +15, +30, +10, +3 have been added to make the mean of all the corrections zero. In the next column means are taken for adjacent divisions as the positions of the *réseau* lines are estimated with respect to the two lines of the scale between which they fall. Again, for the *y* co-ordinate as the two images (6^m and 3^m exposures) are seven divisions of the scale apart (20″), means have been taken of the errors at this distance apart, and set down in the column "Mean for 6^m and 3^m Images" against the corresponding argument.

Division Errors of Scale of Right-hand Microscope.

(The unit is ·00001 *réseau* interval = ″·003.)

Thus for the left-hand microscope a measure of an x co-ordinate in which the first two figures after the decimal point are ·35 requires a correction +·00014, or as the measures are only given to four places +·0001. A measure of a y co-ordinate in which the figures after the decimal point are ·35 requires a correction +·00007, or to four figures +·0001. As explained on pp. xxii, xxiii of Vol. I., the plates whose centres are at an even degree of declination are measured with the left-hand microscope, and those at an odd degree with the right-hand microscope.

PLATE CONSTANTS.

The plate constants were determined by the method and formulæ given by Prof. Turner in the *Monthly Notices of the Royal Astronomical Society*, November 1893. For the determination of the standard co-ordinates of the reference stars between Declinations 71° and 85° the trigonometrical formulæ and tables mentioned in the Introduction to Volume I (p. xliv.) were employed, the term $\frac{1}{3}\tan^6\frac{\alpha-A}{2}\sin 6\delta\ \mathrm{cosec}\ 5'$ being added when necessary in computing η for plates in the higher zones. The standard co-ordinates of the reference stars from Dec. 85° to the Pole were computed by a method devised by Mr P. H. Cowell and described by him below. For the majority of the stars between Declinations 85° and 86° the standard co-ordinates were computed by both formulæ to check the accordance of the methods.

Standard Co-ordinates of Stars near the Pole.

Let it be required to find the standard co-ordinate of a star whose Right Ascension and Declination are $A+\alpha$, $D+\delta$ on a plate whose centre is A, D.

When D is nearly 90°, the following method of procedure is convenient :—

i. Find the standard co-ordinates $\xi_\circ\ \eta_\circ$ of the star on a plate whose centre is at the pole and whose central *réseau* line in the direction of y decreasing is the projection of the hour circle of right ascension A.

ii. Apply the linear transformation that displaces the centre of this plate to A, D.

The following formulæ are required :—

$$\xi_\circ = \cot(D+\delta)\sin\alpha$$
$$\eta_\circ = -\cot(D+\delta)\cos\alpha$$
$$\xi = \frac{p\,\xi_\circ}{1-s\,\eta_\circ}$$
$$\eta = \frac{q\,\eta_\circ + r}{1-s\,\eta_\circ}.$$

The two last are general formulæ modified by considerations of symmetry. The coefficients p, q, r, s may be found by the following considerations :—

(i.) Consider a star at the pole ; then $\xi_\circ = 0$, $\eta_\circ = 0$, $\xi = 0$, and $\eta = \cot D$.

Hence we have—

$$r = \cot D.$$

(ii.) Consider a star at A, D ; then $\xi_\circ = 0$, $\eta_\circ = -\cot D$, $\xi = 0$, $\eta = 0$.

Hence we have—

$$-q\cot D + r = 0 \text{ and } q = 1.$$

(iii.) Consider a star at A, $\frac{D+90^\circ}{2}$; then $\xi_\circ = 0$, $\eta_\circ = -\tan\frac{90-D}{2}$; $\xi = 0$, $\eta = \tan\frac{90-D}{2}$.

Hence—

$$s = \cot D.$$

(iv.) $\xi = \frac{p\,\xi_\circ}{1-\cot D.\,\eta_\circ}$. By symmetry $_\circ = \frac{p\,\xi}{1+\cot D.\,\eta}$.

Hence—

$$p = \mathrm{cosec}\ D.$$

Hence the formulæ are—

$$\xi = \frac{\operatorname{cosec} D.\ \xi_\circ}{1 - \cot D.\ \eta_\circ}$$

$$\eta = \frac{\eta_\circ + \cot D}{1 - \cot D.\ \eta_\circ}.$$

So far the formulæ are in their simplest algebraical forms, and the radian is taken as the unit.

Let R denote the ratio of the radian to 300″ (1 *réseau* interval) and let m, n denote two numerical quantities nearly unity, whose values will be assigned later.

Then the precepts are—

(i.) calculate

$$m\,\xi_\circ = \quad m\ \text{R.}\cot(D+\delta)\sin\alpha$$
$$n\,\eta_\circ = -n\ \text{R.}\cot(D+\delta)\cos\alpha.$$

(ii.) calculate

$$\xi = \frac{\frac{\sin D}{m}(m\,\xi_\circ)}{\sin^2 D - \frac{\sin D\cos D}{n\,\text{R}}(n\,\eta_\circ)}$$

$$\eta = \frac{\frac{\sin^2 D}{n}(n\,\eta_\circ) + \text{R}\cos D\sin D}{\sin^2 D - \frac{\sin D\cos D}{n\,\text{R}}(n\,\eta_\circ)}.$$

The denominator of these expressions is unity at the plate centre and nearly unity all over the plate, which facilitates division by this quantity. If we choose $m = \sin D$ and $n = \sin^2 D$, no multiplications are required in the numerator. These values of m and n clearly apply to the whole of any particular zone.

The general formulæ last given are quite convenient for computation, but modifications are possible. For the standard co-ordinates of stars on plates of the zones 89°, 88°, 87° and some of those on plates of zone 86°, the formulæ were written—

$$\xi = \frac{\xi_\circ}{\sin D - \cos D/\text{R}.\ \eta_\circ} \qquad \eta = \frac{\eta_\circ \sin D + \text{R}.\cos D}{\sin D - \cos D/\text{R}.\ \eta_\circ}$$

the numerical values of which can be arranged as in the following table :—

Zone.	Numerator of η.	Denominator of ξ and η.
89°	$12 + \eta_\circ - \cdot000152\,(\eta_\circ + 4)$	$1 - \cdot0000254\,(\ _\circ + 6)$
88°	$24 + \eta_\circ - \cdot000609\,(\eta_\circ + 8)$	$1 - \cdot0000508\,(\eta_\circ + 12)$
87°	$36 + \eta_\circ - \cdot001371\,(\eta_\circ + 12)$	$1 - \cdot0000762\,(\eta_\circ + 18)$
86°	$48 + \eta_\circ - \cdot002436\,(\eta_\circ + 16)$	$1 - \cdot000102\ \ (\eta_\circ + 24)$

The use of this method was found advantageous for the stars around the pole, because it was necessary to compute the standard co-ordinates of each of these for all the partially overlapping plates on which it is shown, and of these there are several. A scheme of computation was arranged, so that with one entry of a star's place it was possible to compute conveniently its co-ordinates on all the plates on which the star appears, and as part of this scheme for the stars of declination 85° to 86° it was found suitable to form $m\xi_\circ$ and $n\eta_\circ$ where $m = \mathrm{R}\cos 4^\circ 30'$ and $n = \mathrm{R}\cos^2 4^\circ 30'$. The following arithmetical values are then derived from the formulæ already given :—

Zone.	Numerator of η.	Denominator of ξ and η.
86°	$47\cdot7781 + n\eta_\circ + \cdot000649\,(n\eta_\circ + 54)$	$1 - \cdot000015 - \cdot000102\,(n\eta_\circ + 54)$
85°	$59\cdot7783 + n\eta_\circ - \cdot000725\,(n\eta_\circ + 54)$	$1 - \cdot000010 - \cdot000127\,(n\eta_\circ + 54)$

It must be noted that in these formulæ the co-ordinates are measured from the plate centre. The co-ordinates found from these by the addition of 14 are comparable with those printed in the volume.

The Right Ascensions and Declinations of the reference stars used for the determination of Standard co-ordinates are those of the Greenwich Second Nine Year Catalogue (1900). The number of stars used for each plate is given in the third column of the tables on pp. xxiv. *et seq.*

The plate constants were, in the first instance, determined as if there were six independent constants for each plate. The values adopted and given in the tables (pp. xxiv. *et seq.*) are obtained by computing the differential refraction and aberration from the data given with the list of plates (pp. ii.–xiii.), viz.,—the date, sidereal time, readings of barometer and thermometer, and by adopting $-\cdot00100$ as the value of the scale correction (*i.e.*, one interval of the *réseau* = $\cdot99900 \times 5'$) for all the photographs, as afterwards explained, thus leaving three quantities only, the co-ordinates of the centre and the orientation, to be determined by comparison of the measured and standard co-ordinates. It will be convenient to denote the plate constants derived on the supposition that they are six independent quantities by the Roman letters a, b, c, d, e, f, and those derived on the supposition that there are only three independent quantities by the Italic letters a, b, c, d, e, f.

Corrections for Refraction to Plate Constants.

The effect of differential refraction is given by Prof. Turner (M.N. Nov. 1893) in the form

$$\left.\begin{aligned}\Delta x &= -\beta_0 (1+X^2)\, x - \beta_0 X Y\, y \\ \Delta y &= -\beta_0 X Y\, x - \beta_0 (1+Y^2)\, y\end{aligned}\right\}$$

where X, Y are the co-ordinates of the zenith on the plate.

As the photographs were all taken near the meridian, the amount of these corrections is readily tabulated in terms of the hour angle as follows :—

$\beta_0 (1+X^2)$.

Hour Angle. S—A.	72°–90°	Hour Angle. S—A.	72°–90°	Hour Angle. S—A.	72°–90°

These corrections have been computed using the mean value of the constant of refraction. Thermometer 50°F. Barometer 30 inches. When necessary these further corrections have also been applied both to $\beta_0(1+X^2)$ and $\beta_0(1+Y^2)$:—

Thermometer reading less than 40°	+·00001.
„ „ greater than 60°	−·00001.
Barometer reading less than $29^{in}\cdot5$	−·00001.
„ „ greater than $30^{in}\cdot5$	+·00001.

Differential aberration gives rise to the effects—

$$\left.\begin{aligned}\Delta x &= -k \cos \overline{\mathrm{CW}}\ x \\ \Delta y &= -k \cos \mathrm{CW}\ y\end{aligned}\right\}$$

where as is shown in the previous volume (p. xlv.) $k \cos \mathrm{CW}$ is of the form—

$$m \cos \odot + n \sin (\mathrm{A} - \odot).$$

The following table gives the values of the constants m and n of this formula used in computing the correction for Differential Aberration used in forming the adopted constants for plates in this volume :—

To determine the value of the scale correction, the values of a and e derived from each plate were corrected for the differential refraction and aberration. Each plate thus furnished two determinations of the scale correction. The following table gives the result as derived separately from the mean of all the plates in each zone :—

Value of Correction for Scale.

Zone.	Number of Plates.	Scale Correction.		Mean Discordance of a Single Determination.		Probable Error of Mean Determination.	
		From x measures.	From y measures.	x Measures.	y Measures.	x Measures.	y Measures.

79	36	−·001003	−·001013	·000079	·000052	·000011	·000007
80	36	−·001029	−·000989	·000058	·000066	·000008	·000009
81	36	−·001006	−·000979	·000079	·000086	·000011	·000012
82	36	−·000984	−·001001	·000055	·000079	·000008	·000011
83	24	−·000985	−·000991	·000081	·000056	·000014	·000010
84	24	−·001020	−·001006	·000065	·000055	·000011	·000010
85	24	−·001015	−·000996	·000057	·000063	·000010	·000011
86	16	−·000999	−·001023	·000067	·000049	·000014	·000010
87	16	−·001018	−·000986	·000068	·000050	·000014	·000011
88	12	−·001029	−·000983	·000044	·000070	·000011	·000017
89	8	−·001016	−·000986	·000041	·000061	·000012	·000018
Pole	5	−·001136	−·001098	·000052	·000050	·000020	·000019

Thus the mean value of the scale correction is—

$$-\cdot001002 \pm \frac{\cdot000072}{\sqrt{1290}}$$

or $\quad -\cdot001002 \pm \cdot000002.$

The values of the scale correction determined from each plate as above explained were also arranged in order of date. The means of groups for the four quarters of each year are given in the following table :—

Year.	January to March.			April to June.			July to September.			October to December.		
	No. of Plates.	a.	e.	No. of Plates.	a.	e.	No. of Plates.	a.	e.	No. of Plates.	a.	e.

A small seasonal variation seems to be indicated and a numerical increase at the end of the series, but in view of the uncertainty in the determinations in different years and its very small effect on places of stars even at the edge of a plate, it seems better to adopt a constant scale value.

The value $-\cdot00100$ has been adopted. Thus :—

$$a = -\cdot00100 + \beta_0 (1 + X^2) + k \cos CW.$$
$$e = -\cdot00100 + \beta_0 (1 + Y^2) + k \cos CW.$$

These values of a and e are substituted in the equations for the plate constants and values of b and d deduced. Allowing for the small correction $\beta_0 XY$, the mean of b and d is adopted as the correction for orientation. These adopted values of a, b, d, e are substituted in the equations and the values of c and f deduced.

The table on pages xxiv. *et seq.* gives the adopted plate constants for all the plates in this volume, together with the differences between the adopted constants and the provisional determination in which they were considered as six independent constants for each plate.

Columns 1, 2 and 3, give the number of the plate, the R.A. of the centre, and the number of stars used in the determination of plate constants. Columns 4 to 9 give the adopted plate constants to be used in the determination of "Standard Co-ordinates" from the Measured Co-ordinates. Columns 10 to 13 are the differences between the constants a, b, d, e deduced on the supposition that they are four independent quantities, and the adopted constants a, b, d, e, determined on the supposition that only one unknown quantity, the Orientation, is involved in them.

DETERMINATION OF A STAR'S RIGHT ASCENSION AND DECLINATION FROM ITS MEASURED CO-ORDINATES.

First Method.

It is explained in the Introduction to Vol. I. (pp. lvii and lviii) that if α, δ are the right ascension and declination of a star, A, D the right ascension and declination of the centre of the plate, x, y the measured co-ordinates of a star as given in the measures x_1, y_1, those measured co-ordinates corrected by application of the plate constants and

$$P = \operatorname{cosec} D \operatorname{cosec} 1^s \qquad Q = \frac{2160}{\pi} \cot D + 14$$

$$\log (\alpha - A)^s = \log (x_1 - 14) + \log P - \log (Q - y_1)$$

provided that a correction equivalent to $(\alpha - A) - \tan (\alpha - A)$ is finally applied,

and that

$$\delta = D + (y_1 - 14) - \frac{1}{2}(x_1 - 14)^2 \sin^2 5' \operatorname{cosec} 1'' \tan (D+\eta) - \frac{\eta^3}{3}$$

$$+ \frac{1}{8}\xi^4 \tan (D+\eta)\{3 + \tan^2 (D+\eta)\} + \frac{1}{4}\xi^2\eta^2 \tan (D+\eta)$$

+ terms higher than the fourth order in ξ and η

ξ and η being written for $x_1 - 14$, and $y_1 - 14$ respectively.

Tables were given for P and Q, for the correction to $(\alpha - A)$, for the conversion of $(y_1 - 14)$ into arc, and for the third and fourth terms of the second formula, the use of which for the plates in this volume must be modified, as described below.

The formula for $(\alpha - A)$ applies also to all the plates in this volume, but as $(\alpha - A)$ and therefore the correction $(\alpha - A) - \tan (\alpha - A)$ increases rapidly with the declination of the plate, Table II. is not extended, but when this correction is greater than 1^{sec} the formula should be used in the form

$$\log \tan (\alpha - A)^s = \log (x_1 - 14) + \log \operatorname{cosec} D - \log (Q - y_1).$$

On account of the size of $\tan (D+\eta)$ for plates of declination greater than 80° the values of the first factor of the third term in the formula for δ, as given in Table IV., are not sufficient to give accuracy in the result of the order of hundredths of a second of arc. If such is required, this term is readily computed by logarithms.

Table V. of the previous volume, which is simply a table of tangents, is not repeated here. Table VI. $\left(-\frac{\eta^3}{3}\right)$ is now given under heading Table V., and the values of the fifth term of the series for δ is extended in Table VI. to 85°. It is to be noted that this term is now of such magnitude that the declination of the star must be used as argument of this table.

The term $\frac{1}{4}\xi^2\eta^2 \tan (D+\eta)$, which was neglected in the previous volume as being insensible, amounts to $0''{\cdot}07$ at the corners of plates of declination 86°, and should now be included.

The values of the correction for this term are given in the heading of Table VII. The figures in the columns show the limiting values of the product $\xi\eta$ for which each is applicable.

On account of the difficulty of accurate interpolation in the use of this table it will probably be found more convenient to use the *Second Method* given on the next page for stars of declination 80° and greater.

TABLE VII.

$\frac{1}{4}\,\xi^2\,\eta^2\,tan\,(D+\eta)$.

This table gives the limits of $\xi\eta$ for the values of $(D+\eta)$ in the first column for which the correction in the heading is applicable.

73	83–142	143–182					
72	86–146						

Second Method.

For plates in the immediate neighbourhood of the pole it is convenient to use a formula analogous to that previously explained in the section relating to the computation of Standard co-ordinates.

With the previous notation

$$\xi_0 \sin D = \frac{\xi}{1+\frac{\cot D}{R}\eta} \qquad \eta_0 = \frac{\eta - R\cot D}{1+\frac{\cot D}{R}\eta}$$

The numerical values of these formulæ are shown in the following table—

D.	Numerator of η_0.	Denominator of ξ_0 and η_0.	D.	Numerator of η_0.	Denominator of ξ_0 and η_0.
°	int.		°	int.	
89	$\eta - 12{\cdot}0012$	$1 + {\cdot}0000254\,\eta$	84	$\eta - 72{\cdot}2643$	$1 + {\cdot}0001529\,\eta$
88	$\eta - 24{\cdot}0097$	$1 + {\cdot}0000508\,\eta$	83	$\eta - 84{\cdot}4205$	$1 + {\cdot}0001786\,\eta$
87	$\eta - 36{\cdot}0329$	$1 + {\cdot}0000762\,\eta$	82	$\eta - 96{\cdot}6287$	$1 + {\cdot}0002044\,\eta$
86	$\eta - 48{\cdot}0781$	$1 + {\cdot}0001017\,\eta$	81	$\eta - 108{\cdot}8971$	$1 + {\cdot}0002304\,\eta$
85	$\eta - 60{\cdot}1527$	$1 + {\cdot}0001273\,\eta$	80	$\eta - 121{\cdot}2335$	$1 + {\cdot}0002565\,\eta$

Examples of the use of these formulæ and tables are given below. In example I. the measures of the corresponding images of the same star shown on two plates are converted by the second formulæ into right ascension and declination. In example II. the measures of a star on Plate 4879 are converted into right ascension and declination by each of the methods.

EXAMPLE I.—Find the Right Ascension and Declination of the star 85°·74 whose measured co-ordinates on Plates 4778 and 5929 (page 885) are $x = 19{\cdot}7837$, $y = 24{\cdot}2933$ and $x = 19{\cdot}8198$, $y = 12{\cdot}2485$ respectively. (*By Second Method.*)

A further discussion of the probable errors of places of the stars deduced from the photographs has been made by comparing the separate results of pairs of plates for a limited number of stars. The right ascensions and declinations of 315 stars between 72° and 85° have been deduced, one star at least being taken on each plate in these zones, and the places of each star from its corresponding images on overlapping plates compared. The mean differences were found to be ±0″·37 in R.A. and ±0″·39 in declination. From this it results that the probable errors (in arc of a great circle) of the right ascension and declination of a star deduced from the measures on one plate are ±0″·22 and ±0″·23 respectively. The probable errors corresponding to the mean discordances given in the table above are ±0″·23 and ±0″·27 in the two elements, so that taking both discussions together, the probable error of the right ascension or declination of a star deduced from the measures of one plate may be taken as ±0″·24, and the probable error of a catalogue place from the mean of two plates as ±0″·17.

W. H. M. CHRISTIE.

GREENWICH ASTROGRAPHIC CATALOGUE, 1900

VOL. II.

DEC. + 72° TO + 90°.

MEASURES OF

RECTANGULAR CO-ORDINATES AND DIAMETERS

OF STAR IMAGES ON PHOTOGRAPHS

TAKEN AT THE ROYAL OBSERVATORY, GREENWICH.

EDINBURGH:
PRINTED FOR HIS MAJESTY'S STATIONERY OFFICE,
BY NEILL & COMPANY, LTD., BELLEVUE.

1904.

NOTE.

The rectangular co-ordinates of the stars are measured with reference to *réseau* lines on each plate, which are numbered from 1 to 27 in direction of increasing R.A. and Dec. respectively, and are 5^{mm} apart, representing 5′ very nearly. The centre of each plate is at the intersection of the lines numbered 14. The co-ordinates are expressed in units of 1 *réseau* interval, and are given to 4 decimals, the unit in the last place representing 0″·03.

Portions of two plates covering the same part of the sky are measured together, and the corresponding co-ordinates of the same star are printed in parallel columns. The limits of measurement are fixed so as to ensure that every part of the sky is measured on two photographs and two only, as explained in the Introduction to Vol. I. The stars are arranged in the order of the x co-ordinate for each *réseau* interval or zone of 5′.

Each reference number corresponds to a separate star. In a few instances the same star occurs twice, in which case the number given to the star is repeated, and attention drawn to it in the notes.

For the better determination of plate constants, reference stars are measured, although their co-ordinates are outside the assigned limits, provided they fall within the *réseau* which covers 65^{mm} (equivalent to 65′) from the central line in each direction. These measures are given at the end, a line being drawn to separate them from the other measures, and the reference numbers being omitted, as the stars can readily be identified by the No. in the *Bonn Durchmusterung*, given in the last column.

The co-ordinates printed are usually the means of four measures, the 6^m and 3^m images being each measured in reversed positions of the plate. The sign * denotes that the co-ordinates depend on two measures only, the 3^m image being invisible or too faint for measurement. The sign † denotes that three measures were made, one of the measurers considering the 3^m image too faint for accurate measurement. The sign § denotes that an image of the star was shown on the plate with the subsidiary 20^s exposure.

The diameters printed are those of the 6^m images, the sum of the measures of two measurers being given. As the units in which the measures are made are thousandths of a *réseau* interval, the unit employed in the sum of the measures as printed is 0·0005 int., representing 0″·15; thus 26 represents 3″·9.

A reference is given to the stars contained in the *Bonn Durchmusterung*, and the magnitudes of the stars given in that work are printed for comparison with the measured diameters.

The Plate number shows the order in the series of plates taken with the Astrographic Equatorial. The date of exposure (astronomical reckoning) is given adjoining the plate number.

Plates 4600, 3335. The 3m image of 526 coincides with the 6m image of 525, and is therefore not measured.
Plate 3335. No. 552. Both images of this star fall on a *réseau* line, and are therefore not measurable.
Plate 3335. Nos. 584, 585. The images are not separable and have been measured as one mass.

1 *réseau* interval represents very nearly 5′ = 64s·7 at Dec. + 72°, and 68s·4 at Dec. + 73°.

ZONE + 72°.

B. D. 72°·90. The R.A. given in the B. D. corresponds to the measure of No. 806, but the diameter of 807 suggests that the R.A. of this star given in the B. D. may be $1^{min.}$ too small.

1 *réseau* interval represents very nearly $5' = 64^{s}\cdot7$ at Dec. + 72°, and $68^{s}\cdot4$ at Dec. + 73°.

ZONE + 72°.

Plate 4177. Nos. 1860, 1861. The images are not separable but are measured as one mass.

1 *réseau* interval represents very nearly $5' = 64^s{\cdot}7$ at Dec. + 72°, and $68^s{\cdot}4$ at Dec. + 73°.

ZONE + 72°.

No. 3141. Plate 3372. The 6^m image is on a *réseau* line. The diameter given is that of the 3^m image.

1 *réseau* interval represents very nearly $5' = 64''{\cdot}7$ at Dec. + 72°, and $68''{\cdot}4$ at Dec. + 73°.

ZONE + 72°.

No. 3911. This is a double star. Its components are not separable for the 6m and 3m images, but are measured as one mass on both plates. The 20s image on Plate 3738 shows the companion to be ·000 in *x* and —·007 in *y* distant from the principal star.

1 *réseau* interval represents very nearly 5′ = 64s·7 at Dec. + 72° and 68s·4 at Dec. + 73°.

ZONE + 72°.

Plate 4762. No. 4235. The 3m image coincides with a fault in the plate.

1 *réseau* interval represents very nearly 5′ = 64s·7 at Dec. + 72°, and 68s·4 at Dec. + 73°.

ZONE + 72°.

Plate 4762. No. 4332. Both images of this star coincide with faults on the plate.

1 *réseau* interval represents very nearly $5' = 64^s{\cdot}7$ at Dec. + 72°, and $68^s{\cdot}4$ at Dec. + 73°.

ZONE + 72°.

No. 7728. This appears to be a double star. The components are not separable and are measured as one mass.

1 *réseau* interval represents very nearly 5′ = 64s·7 at Dec. + 72°, and 68s·4 at Dec. + 73°.

ZONE + 72°.

No. 8400. This is a double star whose components are not separable in the 6m and 3m images. Measures of the 20s images give differences +·0060 in the *x* co-ordinate and +·0046 in the *y* co-ordinate.

1 *réseau* interval represents very nearly 5′ = 64s·7 at Dec. + 72°, and 68s·4 at Dec. + 73°.

ZONE + 72°.

No. 8547. B.D. 71° 993. The declination given in the B.D. appears to be about 3′ too small.

1 *réseau* interval represents very nearly 5′ = 64ˢ·7 at Dec. + 72°, and 68ˢ·4 at Dec. + 73°.

ZONE + 72°.

No. 9135. B.D. 72° 1023. The declination given in the B.D. appears to be about 3′ too small.

1 *réseau* interval represents very nearly 5′ = 64ˢ·7 at Dec. + 72°, and 68ˢ·4 at Dec. + 73°.

ZONE + 72°.

No. 9503. This star is double. The components are not separable, but are measured as one mass on both plates.

Plate 4690. No. 9585. Images on *réseau* line, 3m image not measured.

1 *réseau* interval represents very nearly 5′ = 64s·7 at Dec. + 72°, and 68s·4 at Dec. + 73°.

ZONE + 72°.

Plate 3284. No. 421. The 6m image is not measurable. The diameter given is that of the 3m image.

1 *réseau* interval represents very nearly 5′ = 68″·4 at Dec. + 73°, and 72″·6 at Dec. + 74°.

ZONE + 73°.

No. 455. It is assumed that this star is B.D. 73°·41 because the measured diameter agrees with the magnitude, but the measures of No. 456 are more accordant with the R.A. and Dec. given in the B.D.

1 *réseau* interval represents very nearly 5′ = 68s·4 at Dec. + 73°, and 72s·6 at Dec. + 74°.

ZONE + 73°.

R.A. 0h 48m to 1h 0m—*contd.*

No. 909. This appears to have a small companion which is not measurable separately. The 20sec images show that its x and y co-ordinates on Plate 3316 are less than those of the principal star by about ·0007 and ·0187 respectively.

Plate 2940. No. 917. The 3m image coincides with the 6m image of No. 916 and is therefore not measurable.

1 *réseau* interval represents very nearly 5′ = 68s·4 of R.A. at Dec. + 73°, and 72s·6 at Dec. + 74°.

ZONE + 73°.

Plate 4760. Nos. 2995, 2996. Measured as one mass.

1 *réseau* interval represents very nearly $5' = 68^s{\cdot}4$ of R.A. at Dec. + 73°, and $72^s{\cdot}6$ at Dec. + 74°.

ZONE + 73°.

R.A. 7h 12m to 7h 24m

Plate 4761. No. 3550. The 3m image falls on a *réseau* line.

Plates 4761, 4793. No. 3544. From comparison of the images of this star shown on these and six other plates it seems that this star is variable.

1 *réseau* interval represents very nearly 5′ = 68s·4 of R.A. at Dec. + 73°, and 72s·6 at Dec. + 74°.

ZONE + 73°.

No. 3969. This is a double star whose components are not separable in the 6m and 3m images. Measures of the 20sec. images of the components, which are approximately equal in magnitude, on Plate 2516, give differences + ·0130 and − ·0094 in the x and y co-ordinate respectively.

1 *réseau* interval represents very nearly 5′ = 68s·4 of R.A. at Dec. + 73°, and 72s·6 at Dec. + 74°.

ZONE + 73°.

Plate 4885. No. 4783. The 6m image falls on a *réseau* line. The diameter given is that of the 3m image.

1 *réseau* interval represents very nearly 5′ = 68s·4 of R.A. at Dec. + 73°, and 72s·6 at Dec. + 74°.

ZONE + 73°.

No. 4870. B.D. 73° 584. The declination given in the B.D. appears to be about 3′ too small.

1 *réseau* interval represents very nearly 5′ = 68ˢ·4 of R.A. at Dec. + 73°, and 72ˢ·6 at Dec. + 74°.

ZONE + 73°.

Plate 4896. No. 4985. The 6m image falls on a *réseau* line. The diameter given is that of the 3m image.

1 *réseau* interval represents very nearly 5′ = 68s·4 of R.A. at Dec. + 73°, and 72s·6 at Dec. + 74°.

ZONE + 73°.

Plate 4690. Nos. 8702, 8729. The 6m image falls on a *réseau* line. The diameter given is that of the 3m image.

1 *réseau* interval represents very nearly 5′ = 68s·4 of R.A. at Dec. + 73°, and 72s·6 at Dec. + 74°.

ZONE + 73°.

R.A. $23^h\ 12^m$ to $23^h\ 24^m$—*contd.*

Plates 3310 and 5098. Nos. 188, 293, 315, 316, 317, 327, and 328 are measured also on plates 4770 and 4752.

Plate 4752. No. 386. The 6m image falls on a *réseau* line. The diameter given is that of the 3m image.

1 *réseau* interval represents very nearly 5′ = 72s·6 of R.A. at Dec. + 74°, and 77s·3 at Dec. + 75°.

ZONE + 74°.

No. 515. B.D. 74°·57. The declination given in the B.D. appears to be about 2′ too small.

1 *réseau* interval represents very nearly 5′ = 72ˢ·6 of R.A. at Dec. + 74°, and 77ˢ·3 at Dec. + 75°.

ZONE + 74°.

R.A. $0^h\ 59^m\ 30^s$ to $1^h\ 23^m\ 45^s$—*contd.*

No 7722. B. D. 74° 922. The Right Ascension given in the B.D. appears to be 1m too small.

No. 7797. B. D. 74° 938. The declination given in the B.D. appears to be about 2′ too large.

1 *réseau* interval represents very nearly 5′ = 72s·6 of R.A. at Dec. + 74°, and 77s·3 at Dec. + 75°.

ZONE + 74°.

R.A. 21h 47m 30s to 22h 0m 0s—*contd.*

1 *réseau* interval represents very nearly $5' = 72^s{\cdot}6$ of R.A. at Dec. + 74°, and $77^s{\cdot}3$ at Dec. + 75°.

ZONE + 75°.

In the Zone +75° to +80°, stars given in the *Astronomische Gesellschaft (Kasan) Catalogue* and not in the *Bonn Durchmusterung (B.D)* are indicated by the letter K followed by the reference number of the *Kasan Catalogue.*

Plate 3909. No. 2936. The 6m image coincides with a *réseau* line. The diameter given is that of the 3m image.

1 *réseau* interval represents very nearly 5′ = 77s·3 of R.A. at Dec. + 75°, and 82s·7 at Dec. + 76°.

ZONE + 75°.
